

Galassia fluorescent flowers – notes for florists

To obtain the spectacular effects of Galassia Flowers, all you need to do is:

- Add water to the spray bottle and mix a couple of times
- Apply the Galassia formulation with a few short sprays about 30-45 cm from the flowers or foliage
- Position the flowers next to the Galassia illumination device – fix them with glue or wire
- A simple flick of the switch reveals the fluorescence – adding splendour to beauty!
- It is that simple.

The spray dries within minutes of application. The spray does not rub off.

The formulation lasts for months after application – much longer than the flowers!

The formulation can be re-applied to brighten the effect whenever you want. The formulation can be sold to consumers.

One bottle of Galassia formulation (8 mL) will treat at least 10 to 20 flowers.

The shelf life of the powdered product is several months - once water has been added, it needs to be kept in the refrigerator.

The product is being distributed in Adelaide by Tony's Flowers

The formulation can be washed off leaves or clothes with warm water and detergent.

The formulation is non-toxic, although one should avoid contact with eyes and it should not be ingested.

Avoid direct eye contact with the LEDs for prolonged periods.

Galassia Flowers™ was developed by Bioconst™ Pty Ltd, a research company dedicated to using advanced technologies to develop environmentally friendly solutions.
